

ABSTRACT

The effervescent tablet dispenser may be assembled onto the open end of a container tube (2). It consists of an annular lower part (3) which may be assembled onto the open end of a container tube (2). For this there is a lid (4) for closing the annular lower part (3). A dispenser tab (8) extends diametrically in a tongue-like manner in the lower part (3) in its clear opening. This dispenser tab (8) is integrally formed on the inner edge (10) of the lower part (3) in the manner of a film hinge. With respect to the annular lower part (3) is may be pivoted out in the axial direction by at least 10 °. When the container tube is tipped, the dispenser tab under the load of a tablet lying on it pivots approx. 10° downwards and the lowermost tablet may be easily removed with one hand, whilst the remaining ones are held back.
